

# The strategic allocation of working memory and episodic memory in prospective remembering: A neural network model

Ida Momennejad\*, Momchil Tomov\*, Kenneth A. Norman, Jonathan D. Cohen Princeton Neuroscience Institute, Princeton University

# I. Background

The successful realization of future plans, prospective memory or PM, requires the agent to maintain and retrieve a goal for execution at a future time. PM poses a memory problem for periods during which the agent is occupied with other ongoing tasks (OG) while being responsive to target events that demand goal execution. We suggest a mechanistic account of how working memory (WM) and episodic memory (EM) strategies are integrated to strike the right balance between maintenance and retrieval when solving varieties of PM problem.

#### II. Behavioral paradigm OG task: Category match PM task: Syllable match **VEHICLE** $\mathbf{PM}$ instruction Block order: BUILDING Target: tor \* non-PM (baseline OG) "It is very important that you **ANIMAL** \* PM every occurrence of the \* non-PM (aftereffects) **SUBJECT** NO NO PM YES YES Einstein et al. 2005 **Correct resposnes:**

improves PM

# III. Neural network model Input-output mapping

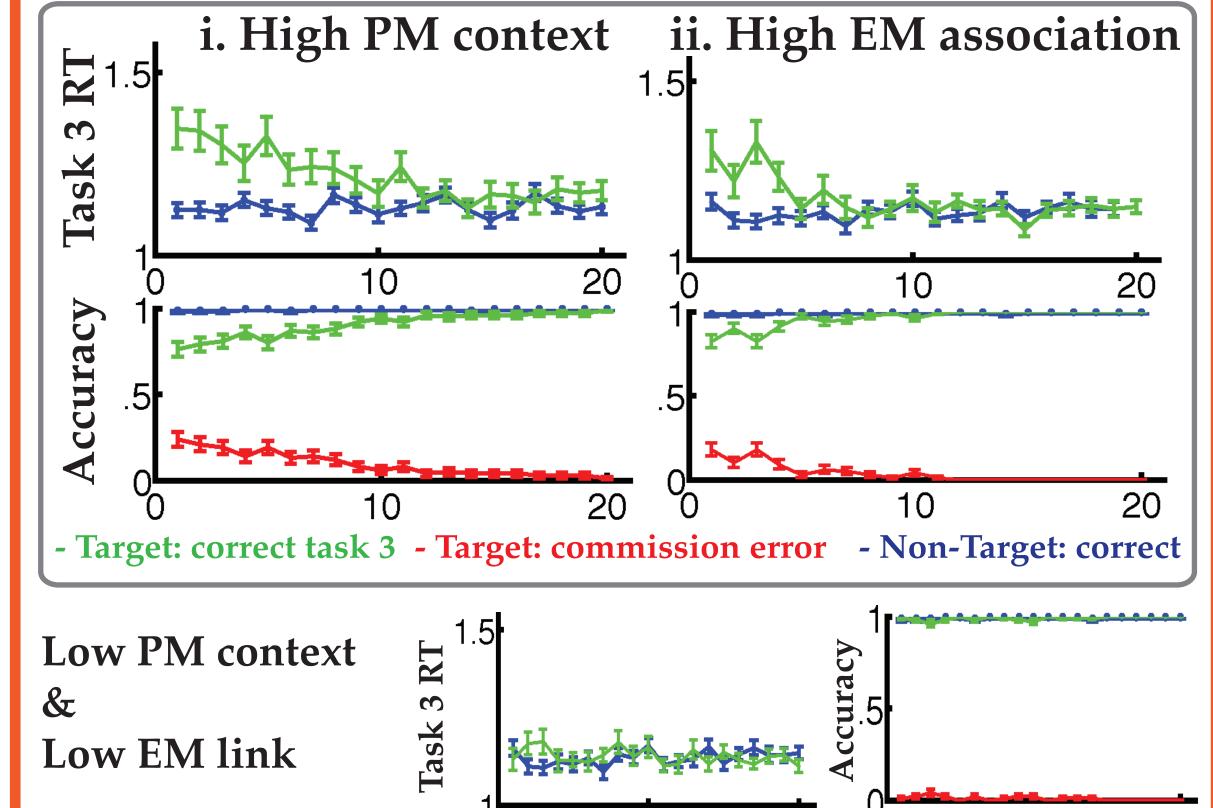

WM control network: dynamics of LCAs (2)

# VI. Commission errors

Commission errors: PM response is made outside PM context. We suggest (i) strong encoding of PM context or (ii) strong EM target-task association can trigger a bottom-up reaction to a former PM target. Over time, context activation & hence CEs diminish.

# IV. Simulation of major behavioral phenomena

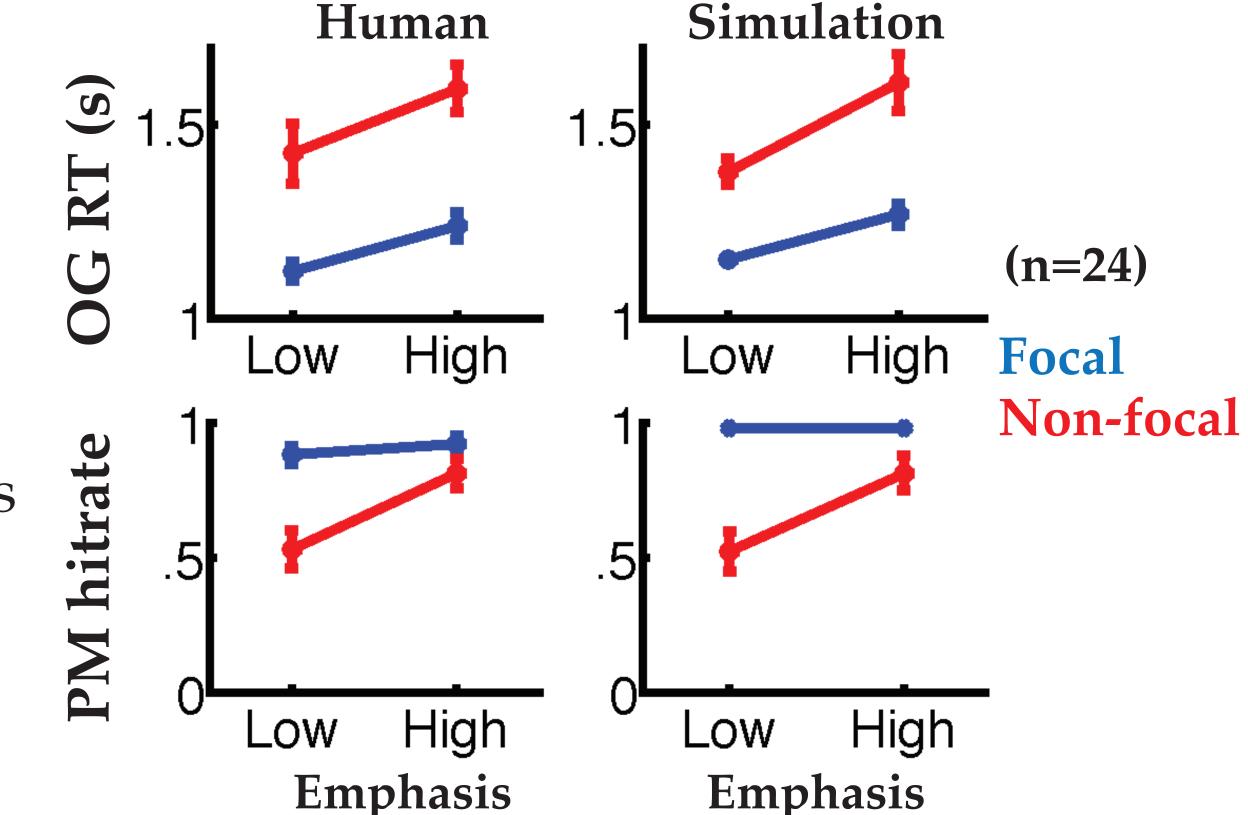

### Focal PM:

OG task's stimulus features are same as PM target's

### Non-focal PM:

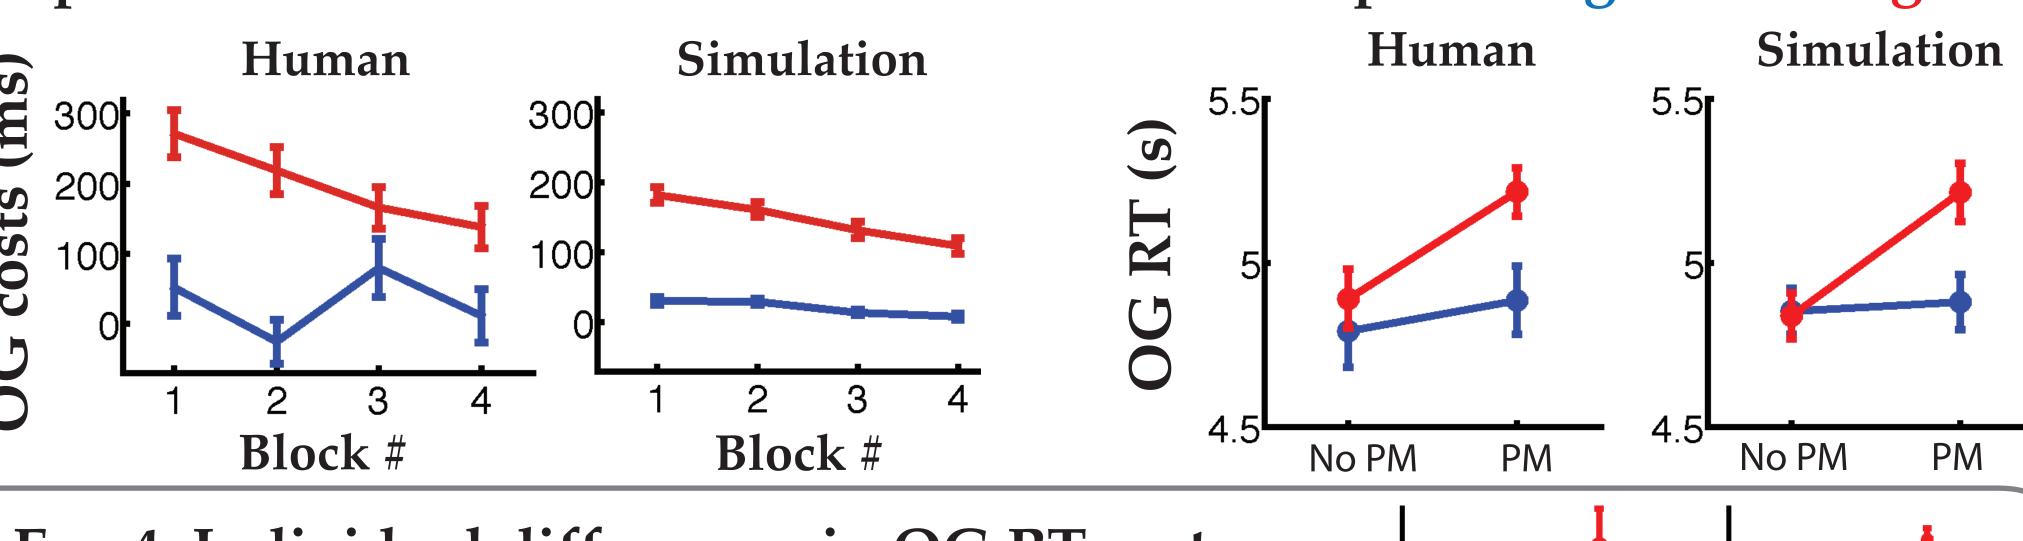

Attention to different features for OG stimuli vs. PM target PM emphasis:

Priority of PM vs. OG (e.g. PM more rewarding)

Exp 2. Focal vs. nonfocal costs over time

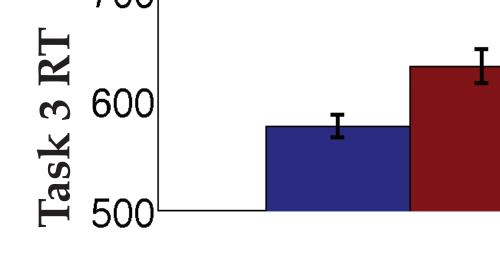

Exp 3. 1 target vs. 6 targets

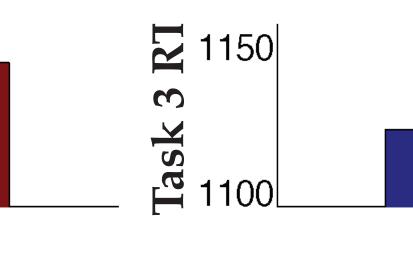

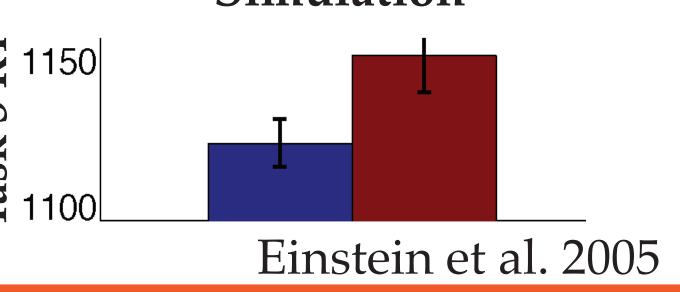

Exp 4. Individual differences in OG RT costs reflect low cost vs. high cost strategies (n=104)

Simulation Exp 5. After-effects

after PM task is over, slower RT to a former target during 3rd task

## Conclusions

Our mechanistic model combines WM & EM strategies to solve the prospective memory problem, & shows human-like regulation of planned action while perfomring ongoing tasks. Representations & dynamics derived from the model can be compared to patterns & dynamics of fMRI data from PM paradigms to test our proposed mechanism.
